

# OECD-G20: blockchain / DLT

27 марта 2019

## ОЭСР сегодня

- сбор данных, методология, авторитетные стандарты, измерение и аналитика по широкому спектру проблем, оценка потенциала и прогноз
- поиск научно обоснованных решений по вопросам глобальной повестки развития
- лучшие практики и кейсы
- разработка практических политик и комплексных стратегий для национальных правительств и международного регулирования

# Going Digital Toolkit

The Going Digital Toolkit helps countries assess their state of digital development and formulate policy strategies and approaches in response. Data exploration and visualisation are key features of the Toolkit.

# Governance Framework for Distributed Ledgers

## Technical Code

Technical code can be an effective governance tool when it reduces market frictions/regulatory burdens and also achieves its broader policy goals. Regulators can provide "utility services" that are pluggable into blockchains, standardizing cross-industry components such as identity or fiat digital currency. In other instances governments can provide profit-neutral services (i.e. escrow as a service for real estate) in areas where economic risk is concentrated or there is little incentive for participants to collaborate.

## Policy Goals & Principles

By participating in the formative days of the technology, governments can ensure broad policy goals such as transparency and public engagement are incorporated into the core design of the system and so that the benefits of "decentralized coordination" are illuminated.

Governance in a distributed economy will require a thoughtful balance of broad policy goals and principles, participation in standards setting, and developing technical code to maximize value for both citizens and businesses.

## Standards Participation

Governments have the unique ability to work across industries and protocols to ensure technology standards harness network effects, promote interoperability and minimize redundancy. By acting as neutral arbiters in the "standard setting" process governments can help minimize risks such as coordination costs.

# Blockchain Design Principles for Government <sup>2</sup>

The design principles of blockchain can be a lever for government's transformation as they enable:

## Inherent Trust & Integrity

Trust is intrinsic in a distributed ledger system, encoded in every process and shared equally among participants.

Blockchains' unique ability to render information "immutable" makes data uniquely authoritative and nearly impossible to alter. This increases confidence in integrity and reduces the need for federal, state and local governments to separately reconcile individual registries.

## Shared Value Creation

Blockchains systematically align incentives so that value is generated through collaborative coordination. Systems that reward shared-value creation have the opportunity to more granularly and accurately link policy-making efforts to the needs of tax payers and voters.

## Distributed Power

Blockchains can distribute power to citizens by decentralizing administrative control and providing unparalleled personal information ownership. Decentralized control strengthens the resiliency of democratic checks and balances. When information is equally distributed, data sovereignty empowers the citizen that creates it not the agency that stores it.

## Embedded Security

With strong cryptography and distributed computing forming the basis for the underlying protocol, governments can ensure services are highly reliable and available. Securing citizen data is not a choice or investment to be made by leadership managing government; confidence, security and authenticity must be hard coded into each system's design.

## Privacy & Rights Preserved

The cryptographic nature of the protocol allows governments to balance transparency and privacy. Blockchains can help manage and cryptographically link owners with assets so that ownership is clear and rights are enforceable. By decentralizing data control, governments can vest privacy rights in the hands of the citizens that create it.

## Inclusion & Participation

Not one participant controls a blockchain and everyone has consistent, equal access to all records added to the ledger. An integrated government mechanized and automated by distributed ledgers allows leadership to focus its policy and administrative efforts on a governance process that is inclusive of all citizens and tailors services specifically their needs.

# KEY ISSUES FOR DIGITAL TRANSFORMATION IN THE G20

---

*Report prepared for a joint  
G20 German Presidency/  
OECD conference*

BERLIN, GERMANY  
12 JANUARY 2017

# Март 2018

ОЭСР призвала финансовых регуляторов мира к созданию стандартов для налогообложения развивающихся технологий

в планах ОЭСР разработка практических инструментов и установление сотрудничества со странами-участницами G20 по «изучению налоговых последствий новых технологий», в частности, криптовалют и технологии блокчейн
